DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, sub-assemblies and materials; it is made up of four series of handbooks each comprising several parts.

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

This information is furnished for guidance, and with no guarantee as to its accuracy or completeness; its publication conveys no licence under any patent or other right, nor does the publisher assume liability for any consequence of its use; specifications and availability of goods mentioned in it are subject to change without notice; it is not to be reproduced in any way, in whole or in part without the written consent of the publisher.

ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks is comprised of the following parts:

- T1 Tubes for r.f. heating**
- T2 Transmitting tubes for communications**
- T3 Klystrons, travelling-wave tubes, microwave diodes**
- ET3 Special Quality tubes, miscellaneous devices (will not be reprinted)**
- T4 Magnetrons**
- T5 Cathode-ray tubes**
Instrument tubes, monitor and display tubes, C.R. tubes for special applications
- T6 Geiger-Müller tubes**
- T7 Gas-filled tubes**
Segment indicator tubes, indicator tubes, dry reed contact units, thyratrons, industrial rectifying tubes, ignitrons, high-voltage rectifying tubes, associated accessories
- T8 Picture tubes and components**
Colour TV picture tubes, black and white TV picture tubes, colour monitor tubes for data graphic display, monochrome monitor tubes for data graphic display, components for colour television, components for black and white television and monochrome data graphic display
- T9 Photo and electron multipliers**
Photomultiplier tubes, phototubes, single channel electron multipliers, channel electron multiplier plates
- T10 Camera tubes and accessories, image intensifiers**
- T11* Microwave components and assemblies**

* Will become available in the course of 1982.

SEMICONDUCTORS (RED SERIES)

The red series of data handbooks is comprised of the following parts:

- S1 Diodes**
Small-signal germanium diodes, small-signal silicon diodes, voltage regulator diodes ($< 1,5 \text{ W}$), voltage reference diodes, tuner diodes, rectifier diodes
- S2 Power diodes, thyristors, triacs**
Rectifier diodes, voltage regulator diodes ($> 1,5 \text{ W}$), rectifier stacks, thyristors, triacs
- S3 Small-signal transistors**
- S4 Low-frequency power transistors and hybrid IC modules**
- S5 Field-effect transistors**
- S6 R.F. power transistors and modules**
- S7 Microminiature semiconductors for hybrid circuits**
- S8 Devices for optoelectronics**
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.
- S9 Taken into handbook T11 of the blue series**
- S10 Wideband transistors and wideband hybrid IC modules**

INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks is comprised of the following parts:

- IC1** **Bipolar ICs for radio and audio equipment**
- IC2** **Bipolar ICs for video equipment**
- IC3** **ICs for digital systems in radio, audio and video equipment**
- IC4** **Digital integrated circuits**
 LOC MOS HE4000B family
- IC5** **Digital integrated circuits – ECL**
 ECL10 000 (GX family), ECL100 000 (HX family), dedicated designs
- IC6*** **Professional analogue integrated circuits**
- IC7** **Signetics bipolar memories**
- IC8** **Signetics analogue circuits**
- IC9** **Signetics TTL logic**

* This handbook will be available by the end of 1982.

COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks is comprised of the following parts:

- C1 Assemblies for industrial use**
PLC modules, PC20 modules, HNIL FZ/30 series, NORbits 60-, 61-, 90-series, input devices, hybrid ICs, peripheral devices
- C2 Television tuners, video modulators, surface acoustic wave filters**
- C3 Loudspeakers**
- C4 Ferroxcube potcores, square cores and cross cores**
- C5 Ferroxcube for power, audio/video and accelerators**
- C6 Electric motors and accessories**
Permanent magnet synchronous motors, stepping motors, direct current motors
- C7 Variable capacitors**
- C8 Variable mains transformers**
- C9 Piezoelectric quartz devices**
Quartz crystal units, temperature compensated crystal oscillators, compact integrated oscillators, quartz crystal cuts for temperature measurements
- C10 Connectors**
- C11 Non-linear resistors**
Voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC)
- C12 Variable resistors and test switches**
- C13 Fixed resistors**
- C14 Electrolytic and solid capacitors**
- C15 Film capacitors, ceramic capacitors**
- C16 Piezoelectric ceramics, permanent magnet materials**

TELEVISION TUNERS AND AERIAL INPUT ASSEMBLIES

V.H.F./U.H.F. TELEVISION TUNER

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G	
Channels	E2 to R4 (band I)	←
	M4 to E12 (band III)	
	E21 to E69 (bands IV and V)	
Intermediate frequencies		
picture	38,9 MHz	
sound	33,4 MHz	

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, with extended v.h.f. frequency ranges. This tuner is basically interchangeable with the ELC2000.

DESCRIPTION

→ The ELC2004 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the v.h.f. band I, E2 to the Italian channel C and the OIRT channel R4 (frequency range 48 to 92 MHz), the v.h.f. band III including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feed-through capacitors in the underside. The mounting method is shown in Figs 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter and switchable bandpass filters, to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF199. The oscillator is equipped with a transistor BF494. The three r.f. circuits are tuned by three capacitance diodes BB809. Switching between v.h.f. I and III is achieved by five switching diodes BA 482, 483 and 484.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner. A test point at the collector of the mixer can be used for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver.

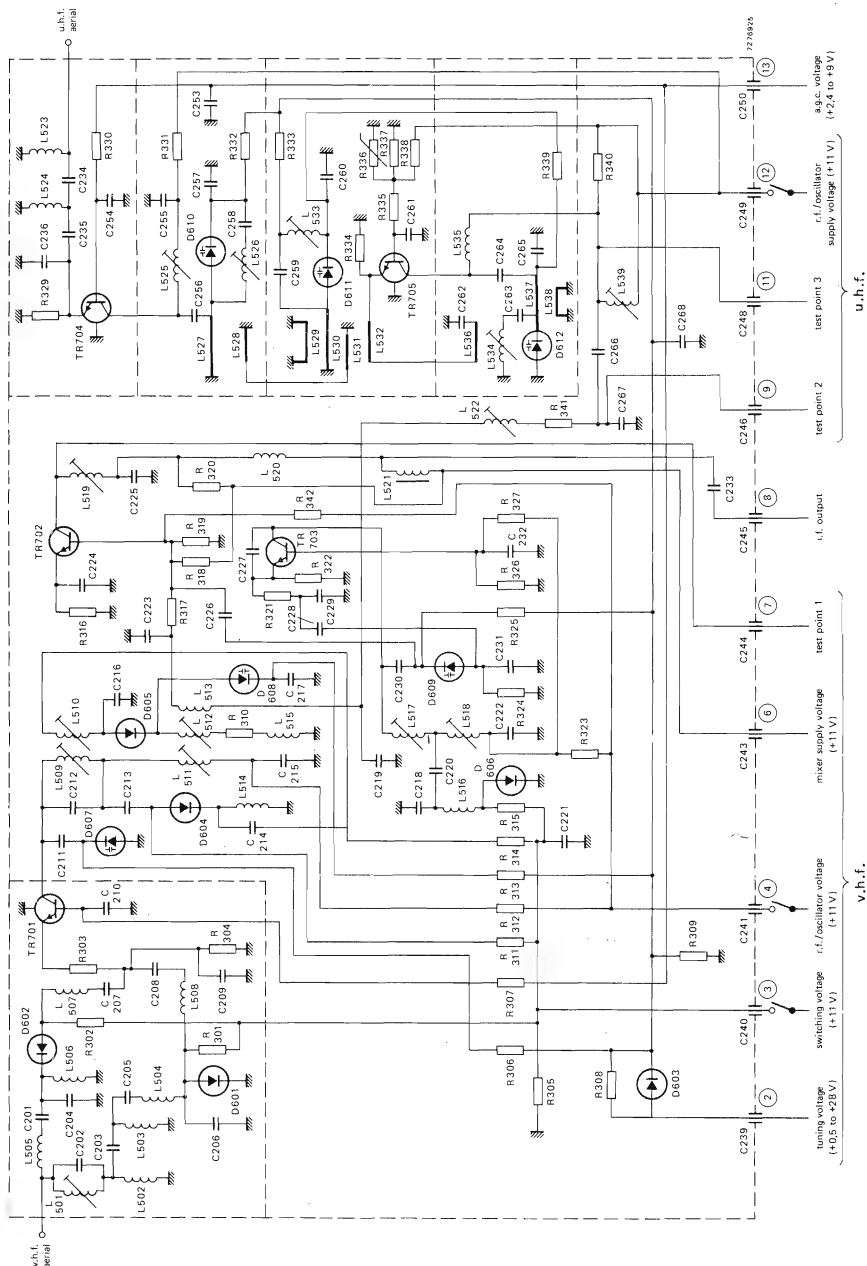

The u.h.f. part of the tuner consists of a high-pass input circuit, connected to the emitter of the amplifier transistor BF180. The interstage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer.

→ The three tuned u.h.f. circuits are tuned by three capacitance diodes BB405B. The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the base of the v.h.f. mixer transistor BF199, now operating as an i.f. amplifier.

The tuner requires transistor supply voltages of + 11 V, a switching voltage of + 11 V, a.g.c. voltages, variable from + 2,4 V (normal operating point) to about + 9 V (maximum a.g.c.) and a tuning voltage, variable from + 0,5 V to + 28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see Accessories).

The ELC2004 tuner is basically interchangeable with the ELC2000. Small modifications in the receiver with respect to a.g.c. and supply voltages may be necessary.

 12 = r.f./oscillator supply voltage, u.h.f., + 11 V (approx. 6 to 13 mA)
 13 = a.g.c. voltage, + 2,4 to + 9 V (3,5 mA)
 E = earth

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board; $e = 2,54$ mm (0,1 in). No connection must be made to the points 7, 9 and 11, as otherwise the oscillator radiation would increase.

Detuning of the i.f. output circuit as a result of band switching and tuning with respect to channel E8

max. 400 kHz

Shift of oscillator frequency at a change of supply voltage of 10%

band I	max. 300 kHz
band III	max. 300 kHz
band IV and V	max. 600 kHz

Shift of oscillator frequency at a gain reduction of 30 dB

max. 100 kHz

Notes see next page.

Drift of oscillator frequency during warm-up time
(measured between 5 s and 15 min after switching on)

band I	max. 100 kHz
band III	max. 100 kHz
bands IV and V	max. 250 kHz

Drift of oscillator frequency at a change of ambient temperature from 25 to 40 °C

band I	max. 300 kHz
band III	max. 300 kHz
bands IV and V	max. 500 kHz

Oscillator radiation

The tuner is in conformity with the radiation requirements of C.I.S.P.R. publication No. 13, provided the following conditions are fulfilled.

- A low-pass filter (Fig. 11) with a cut-off frequency of about 300 MHz has to be inserted between the v.h.f. aerial terminal of the tuner and the aerial terminal of the receiver.
Television receivers with a common v.h.f./u.h.f. connector in combination with a low-pass/high-pass splitter do not need this additional filter.

Fig. 11.

- No connections must be made to terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i.f. amplifier has to be done in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

Surge protection

Protection against voltages max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs

Note: A flash-over circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

Notes

1. Referred to an impedance of 75 Ω .
2. 1% cross-modulation means that 1% of the modulation depth of the interfering signal is transferred to the wanted signal.
3. Criterion of overloading: 30% compression of the synchronization pulses of a standard television signal or a noticeable deterioration of the picture quality.

Fig. 12 Cross-modulation, in channel.

Fig. 13 Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. A convenient way of connecting is given below.

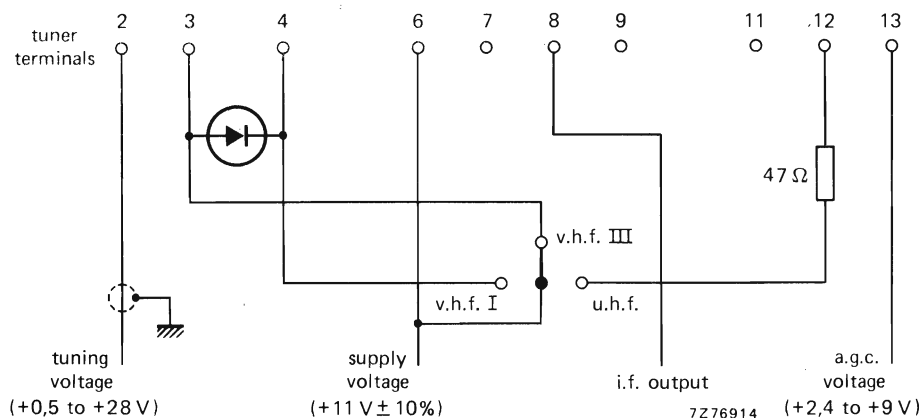

Fig. 14 Connection diagram; diode: BAX13, BA217 or comparable silicon diode.

Alignment of the i.f. circuit

The tuner is provided with a test point at the collector of the v.h.f. mixer, which can be used for i.f. injection to align the i.f. output circuit. The i.f. signal should be fed to test point 1 (terminal 7) via a capacitor of 0,5 to 1 pF (Fig. 15). This capacitor should have short leads to avoid oscillator radiation. After alignment it should be soldered to earth, to avoid detuning of the i.f. circuit (Fig. 16).

Fig. 15.

Fig. 16.

In receivers where the tuner is soldered into a printed-wiring board, the capacitor can be printed as shown in Figs 17 and 18.

Fig. 17.

Fig. 18.

The aligning should be done with the v.h.f. III band tuned. The tuning voltage should be 15 to 20 V. If this injection method cannot be employed in the television receiver (e.g. there is not enough i.f. signal available) the i.f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u.h.f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. The capacitor has to be removed after alignment. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the circuit given in Fig. 19. The terminals 7, 9 and 11 should be not connected.

Fig. 19.

Switch the tuner to the v.h.f. III band; the tuning voltage should be 15 to 20 V. Feed an i.f. sweep signal (e.m.f. 500 to 1000 mV) to test point 1 as given in Alignment of the i.f. circuit. Adjust the trimmer (Fig. 19), tunable coil (L_a/L_b), i.f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given in Fig. 20.

Fig. 20.

Then display the r.f. + i.f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i.f. coils (L_a/L_b and L519), if necessary, to get the 38,9 MHz and 33,4 MHz markers symmetrically on the slopes of the curve and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

low v.h.f. band	E2 to R4
high v.h.f. band	S2 to S19
u.h.f. band	E21 to E69
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

This tuner is designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, including the S channels for cable television. It is interchangeable with tuner ELC2004.

DESCRIPTION

The ELC2006 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band with the channels E2 to R4 (frequency range 47 to 92 MHz), the high v.h.f. band with the channels S2 to S19 (frequency range 111 to 293 MHz), and the u.h.f. band with the channels E21 to E69 (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feed-through capacitors in the under side. The mounting method is shown in Figs 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF183. The oscillator is equipped with a transistor BF494. The four r.f. circuits are tuned by four capacitance diodes BB909B. A capacitance diode BB809 provides a frequency-dependent coupling of the r.f. input signal to the tuned input circuit. Switching between the low and high v.h.f. bands is done by four switching diodes (BA482/483/484). Three switching diodes BA317 are used to make the tuner interchangeable with the ELC2004.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner (low capacitance coupling). An i.f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a high-pass input circuit, connected to the emitter of the amplifier transistor BF180. The inter-stage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer.

The three tuned u.h.f. circuits are tuned by three capacitance diodes BB405B.

The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the emitter of the v.h.f. mixer transistor BF183, now operating as an i.f. amplifier in grounded-base configuration. Band switching between v.h.f. and u.h.f. is achieved by a diode BA243.

The tuner requires transistor supply voltages of + 11 V, a switching voltage of + 11 V, a.g.c. voltages, variable from + 2,4 V (normal operating point) to about + 9 V (maximum a.g.c.) and a tuning voltage, variable from + 0,5 V to + 28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board; $e = 2,54$ mm (0,1 in). No connection must be made to the points 7, 9 and 11, as otherwise the oscillator radiation would increase.

Fig. 4 Recommended fixing method of the aerial cables. Use a self-tapping screw, e.g. 5N x 3/16.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $11 \pm 0,3\text{ V}$ and an a.g.c. voltage of $2,4 \pm 0,2\text{ V}$.

Notes

1. This e.m.f. (open voltage) is referred to an impedance of 75 Ω .
1% cross-modulation means that 1% of the modulation depth of the interfering signal is transferred to the wanted signal.
2. This e.m.f. (open voltage) is referred to an impedance of 75 Ω .
Criterion of overloading: 30% compression of the synchronization pulses of a standard television signal or a noticeable deterioration of the picture quality.
3. This e.m.f. (open voltage) is referred to an impedance of 75 Ω .

Miscellaneous

Oscillator radiation and oscillator voltage at the aerial terminal.

The tuner is in conformity with the radiation requirements of C.I.S.P.R. 13 (1975) and VDE0872/7.72, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 13) with a cut-off frequency of about 300 MHz has to be inserted between the v.h.f. aerial terminal of the tuner and the aerial terminal of the receiver, and a high-pass filter (Fig. 14) with a cut-off frequency of 350 MHz between the u.h.f. aerial terminal of the tuner and the aerial terminal of the receiver.

Television receivers with a common v.h.f./u.h.f. connector in combination with a low-pass/high-pass splitter do not need these additional filters.

Fig. 13.

Fig. 14.

- No connections must be made to terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i.f. amplifier has to be done in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

Surge protection

Protection against voltages

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flash-over circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. A convenient way of connecting is given below.

Fig. 15 Connection diagram; diode BAX13, BA217 or comparable silicon diode is used.

Alignment of the i.f. circuit

The tuner is provided with a test point at the collector of the v.h.f. mixer, which can be used for i.f. injection to align the i.f. output circuit. The i.f. signal should be fed to test point 1 (terminal 7) via a capacitor of 0.5 to 1 pF (Fig. 16). This capacitor should have short leads to avoid oscillator radiation. After alignment it should be soldered to earth, to avoid detuning of the i.f. circuit (Fig. 17).

Fig. 16.

Fig. 17.

In receivers where the tuner is soldered into a printed-wiring board, the capacitor can be printed as shown in Figs 18 and 19.

Fig. 18.

Fig. 19.

The aligning should be done with the v.h.f. III band tuned. The tuning voltage should be 15 to 20 V. If this injection method cannot be employed in the television receiver (e.g. there is not enough i.f. signal available) the i.f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u.h.f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. The capacitor has to be removed after alignment. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the circuit given in Fig. 20. The terminals 7, 9 and 11 should be not connected.

Fig. 20.

Alignment of this circuit in connection with the tuner is done as follows.

Switch the tuner to the v.h.f. III band; the tuning voltage should be 15 to 20 V. Feed an i.f. sweep signal (e.m.f. 500 to 1000 mV) to test point 1 as given in Alignment of the i.f. circuit. Adjust the trimmer (Fig. 20), tunable coil (L_a/L_b), i.f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given in Fig. 21.

Fig. 21.

Then display the r.f. + i.f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i.f. coils (L_a/L_b and L519), if necessary, to get the 38,9 MHz and 33,4 MHz markers symmetrically on the slopes of the curve and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

APPLICATION

Designed to cover the Australian v.h.f. and u.h.f. channels of C.C.I.R. systems B and G.

¹⁾ In accordance with the publications of the Australian Broadcasting Control Board (ABCB).

DESCRIPTION

The ELC2060 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band with the channels 0 to 4 (frequency range 45 to 101 MHz), the high v.h.f. band with the channels 5 to 11 (frequency range 101 to 222 MHz), and the u.h.f. band with the channels 28 to 63 (frequency range 526 to 814 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feed-through capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF183. The oscillator is equipped with a transistor BF494. The four r.f. circuits are tuned by four capacitance diodes BB109G. A capacitance diode BB106 provides a frequency-dependent coupling of the r.f. input signal to the tuned input circuit. Switching between the low and high v.h.f. bands is done by four switching diodes (BA182, BA243, and BA244).

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner (low capacitance coupling). An i.f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a tuned input circuit, connected to the emitter of the amplifier transistor BF183. The inter-stage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer. The four tuned u.h.f. circuits are tuned by four capacitance diodes BB105B.

The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the emitter of the v.h.f. mixer transistor BF183, now operating as an i.f. amplifier in grounded-base configuration. Band switching between v.h.f. and u.h.f. is achieved by a diode BA243.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +2,4 V (normal operating point) to about +7,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

 13 = a. g. c. voltage, u. h. f. , +2,4 to +7,5 V
 E = earth

e = 2,54 mm (0,1 in)

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a snap-in mount or a bracket. Information will be supplied upon request.)

The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

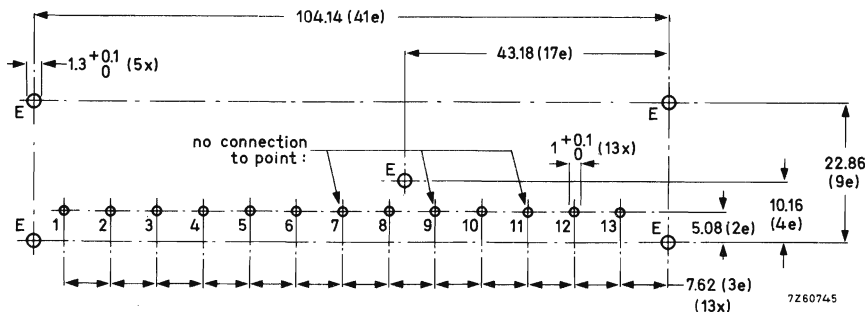

Fig. 3. Piercing diagram viewed from solder side of board; $e = 2,54 \text{ mm}$ (0,1 in).

No connection must be made to the points 7, 9 and 11, otherwise the oscillator radiation may increase.

Fig. 4. Recommended fixing method of the aerial cables. Use a self-tapping screw.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$ and a supply voltage of $12 \pm 0,3\text{ V}$.

Oscillator radiation

The tuner is in conformity with the radiation requirements of the Australian Standard AS 1053-1973 and of C.I.S.P.R. Recommendation No. 24/3, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 11) with a cut-off frequency of about 300 MHz has to be inserted between the v.h.f. aerial terminal of the tuner and the aerial terminal of the receiver. Television receivers with a common v.h.f. /u.h.f. connector in combination with a low-pass/high-pass splitter ¹⁾ may not need this additional filter.

Fig. 11.

- No connections must be made to the terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i.f. amplifier have to be made in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

¹⁾ E.g. coaxial aerial input assembly 3122 127 10450.

Fig. 12. Cross-modulation, in channel.

Fig. 13. Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig.2, should be consulted.
If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads.
Five ways of connecting, depending on the number of switches available, are given below.

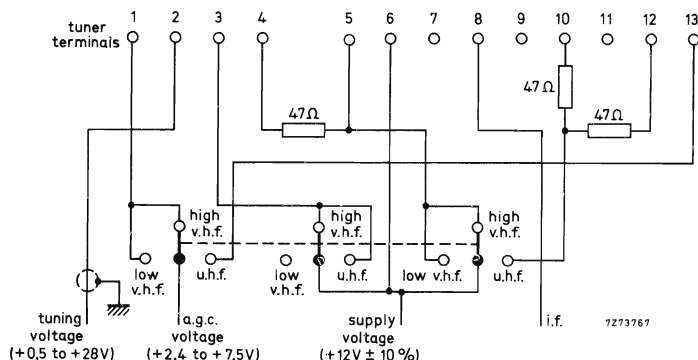

Fig. 14. Connection diagram with three switches.

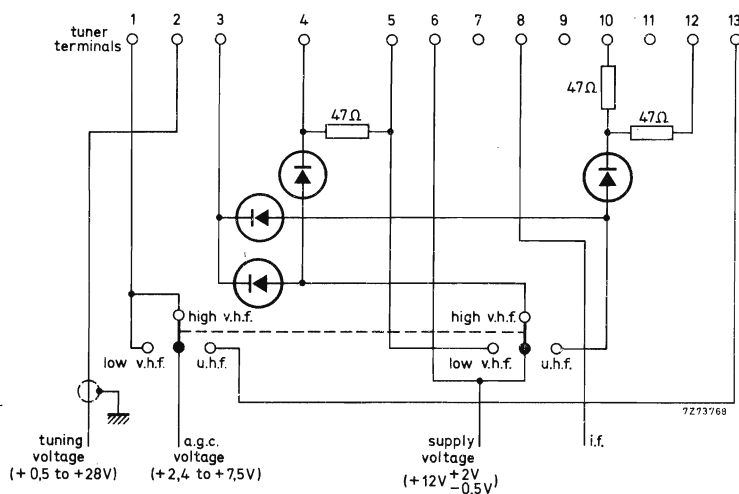

Fig. 15. Connection diagram with two switches.

All diodes : BAX13, BA217 or comparable silicon diodes.

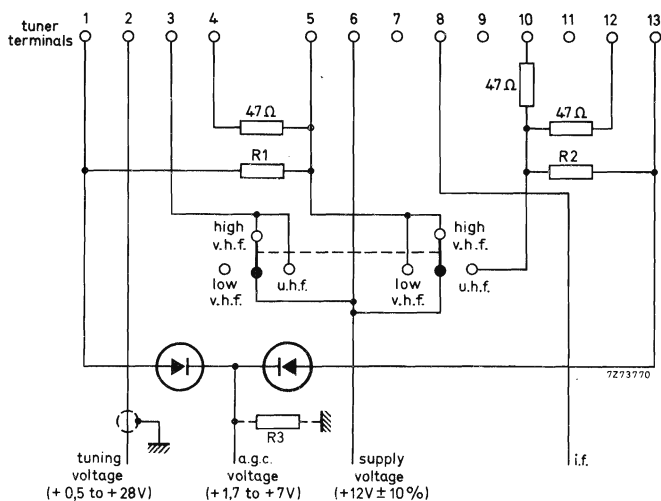

Fig. 16. Connection diagram with two switches.

All diodes: BAX13, BA217 or comparable silicon diodes.

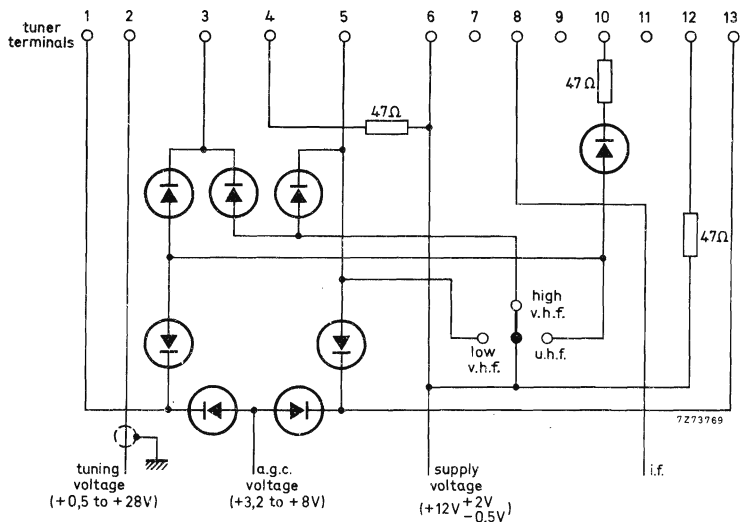

The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

Fig. 17. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.

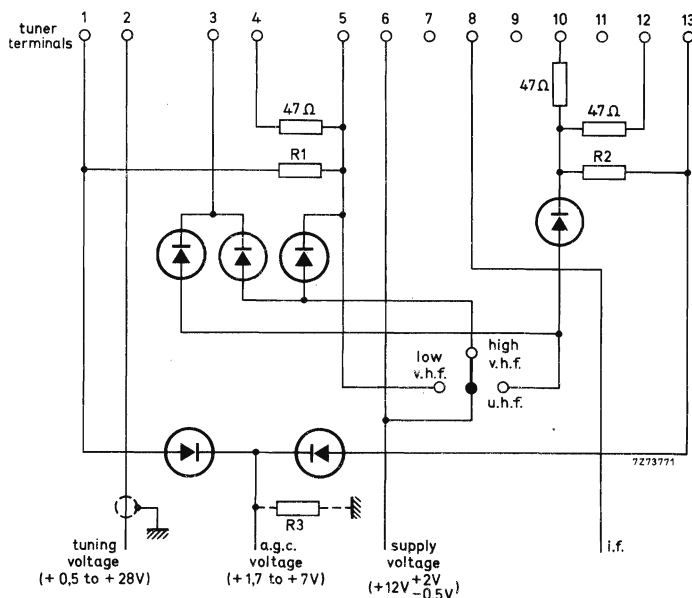

Fig. 18. Connection diagram with one switch.

All diodes : BAX13, BA217 or comparable silicon diodes.

The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

Alignment of the i.f. circuit

The tuner is provided with an i.f. injection point at the collector of the mixer for aligning the i.f. circuit together with the i.f. amplifier of the television receiver (for the position of the i.f. injection point see Fig. 2).

The alignment should be done with the high v.h.f. band tuned. The tuning voltage should be 15 to 20 V.

If this injection method cannot be employed in the television receiver (e.g. because the injection point is not accessible or there is not enough i.f. signal available), the i.f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u.h.f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHODSPower gain

The i. f. output of the tuner should be terminated with the dummy circuit given below.
The terminals 7, 9 and 11 should be not connected.

Fig. 19.

The dummy circuit should be aligned as follows.

Switch the tuner to the high v. h. f. band; the tuning voltage should be 15 to 20 V.

Feed an i. f. sweep signal (500 to 1000 mV) to the i. f. injection point.

Adjust the trimmer (Fig. 19), tunable coil (L_a/L_b), i. f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given below.

Fig. 20.

Then display the r. f. + i. f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i. f. coils (L_a/L_b and L519), if necessary, to get the markers 36, 875 MHz and 31, 375 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

Tuning range of i. f. output circuit

The i. f. output of the tuner should be terminated with the circuit given in Fig. 21. The terminals 7, 9 and 11 should not be connected.

Fig. 21.

with diode tuning

QUICK REFERENCE DATA

System	C.C.I.R. system I
Channels (South African channel distribution)	4 to 13 (v.h.f. band) 21 to 69 (u.h.f. band)
Intermediate frequencies	
picture	38,9 MHz
sound	32,9 MHz

APPLICATION

Designed to cover the South African v.h.f. and u.h.f. channels of C.C.I.R. system I.

DESCRIPTION

The ELC2070 is a combined v.h.f. /u.h.f. tuner with electronic tuning and band switching, covering the South African v.h.f. band (frequency range 174 to 254 MHz) and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage and tuning voltage) are made via feed-through capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF182. The oscillator is equipped with a transistor BF494. The four r.f. circuits are tuned by four capacitance diodes BB106.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner.

An i.f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a tuned input circuit, connected to the emitter of the amplifier transistor BF180. The inter-stage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer. The four tuned u.h.f. circuits are tuned by four capacitance diodes BB105B.

The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the emitter of the v.h.f. mixer transistor BF182, now operating as an i.f. amplifier in grounded-base configuration. Band switching between v.h.f. and u.h.f. is achieved by a diode BA243.

The tuner requires transistor supply voltages of +12 V, a.g.c. voltages, variable from +2,4 V (normal operating point) to about +7,5 V (maximum a.g.c.), and a tuning voltage, variable from +0,5 V to +28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a snap-in mount or a bracket. Information will be supplied upon request.)

The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

Oscillator radiation

The tuner is in conformity with the radiation requirements of C.I.S.P.R. Recommendation No. 24/3, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 9) with a cut-off frequency of about 300 MHz has to be inserted between the v.h.f. aerial terminal of the tuner and the aerial terminal of the receiver. Television receivers with a common v.h.f. /u.h.f. connector in combination with a low-pass/high-pass splitter ¹⁾ may not need this additional filter.

Fig. 9

- No connections must be made to the terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i.f. amplifier have to be made in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

¹⁾ E.g. coaxial aerial input assembly 3122 127 10450.

Fig. 10. Cross-modulation, in channel.

Fig. 11. Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig.2, should be consulted.

If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads.

Three ways of connecting, depending on the number of switches available, are given below.

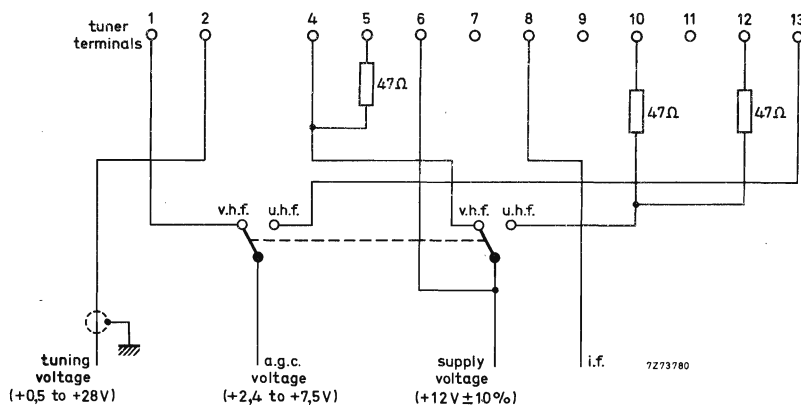

Fig. 12. Connection diagram with two switches.

Fig. 13. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.

Fig. 14. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.

The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

Alignment of the i.f. circuit

The tuner is provided with an i.f. injection point at the collector of the mixer for aligning the i.f. circuit together with the i.f. amplifier of the television receiver (for the position of the i.f. injection point see Fig. 2).

The aligning should be done with the v.h.f. band tuned. The tuning voltage should be 15 to 20 V.

If this injection method cannot be employed in the television receiver (e.g. because the injection point is not accessible or there is not enough i.f. signal available), the i.f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u.h.f. position; the tuning voltage should be approx. 10 V.

This injection method requires approx. 14 dB less signal than the first method.

No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the circuit given below.
The terminals 7, 9 and 11 should be not connected.

Fig. 15

Switch the tuner to the v.h.f. band; the tuning voltage should be 15 to 20 V.
Feed an i.f. sweep signal (500 to 1000 mV) to the i.f. injection point.
Adjust the trimmer (Fig. 15), tunable coil (L_a/L_b), i.f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given below.

Fig. 16

Then display the r.f. + i.f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i.f. coils (L_a/L_b and L519), if necessary, to get the markers 38,9 MHz and 32,9 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

Channels	A2 to A6 (low v.h.f. band) A7 to A13 (high v.h.f. band)
Intermediate frequencies	
picture	45,75 MHz
sound	41,25 MHz

APPLICATION

Designed to cover the v.h.f. channels of C.C.I.R. systems M and N (R.T.M.A.).

Thanks to its good signal-handling properties, the tuner is especially suited for strong signal areas.

DESCRIPTION

The ELC3082 is a v.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band (frequency range 54 to 88 MHz) and the high v.h.f. band (frequency range 174 to 216 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The aerial connection is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via terminals in the under side. The mounting method is shown in Figs 3 and 4.

Electrically, the tuner consists of v.h.f. and i.f. parts. The aerial signal is fed to the input filters, providing i.f. rejection and band selection. The filters are followed by a P-I-N diode attenuator, equipped with two diodes BA379. The output of the attenuator is connected to the emitter of the input transistor BF480, operating as r.f. amplifier in grounded base configuration. The same transistor also delivers the current drive for the P-I-N diode attenuator, controlled by an a.g.c. voltage fed to the transistor base. The combination of the diode attenuator with this high current transistor (I_E at normal gain about 10 mA) has excellent signal-handling properties within the whole a.g.c. range.

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the emitter of the mixer transistor BF324. Good signal-handling properties of this stage are achieved by high oscillator injection. The oscillator is equipped with a transistor BF324. In the low v.h.f. position, self-detection of the oscillator signal is used to back-bias the five switching diodes BA482/483/484, required for band switching between low and high v.h.f. channels. Three capacitance diodes BB809 provide tuning of the r.f. circuits. The collector of the mixer transistor is connected to a single tuned i.f. resonant circuit (about 20 MHz bandwidth), the output of which is fed to the i.f. output stage, equipped with another transistor BF324 in grounded base configuration. This stage has also been designed especially for good signal-handling properties. The collector load of the i.f. output transistor is formed by a single tuned i.f. circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner.

The tuner can be used in combination with a u.h.f. tuner. In this case the u.h.f. i.f. signal is fed to the emitter of the i.f. output transistor, which acts as i.f. amplifier for u.h.f. as well as for v.h.f.

The u.h.f. i.f. input terminal can be used as an i.f. injection point for aligning the i.f. output circuit together with the i.f. amplifier of the television receiver. For the same purpose a separate i.f. injection point has been provided at the collector of the mixer.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +5 V (normal operating point) to about +2,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial input of the tuner is asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORY).

switching diodes	5 x BA482/483/484
i.f. amplifier	BF324

Ambient temperature range

operating	$+5$ to $+55^\circ\text{C}$
storage	-25 to $+85^\circ\text{C}$

Supply voltage

$+12\text{ V} \pm 10\%$

Current drawn from $+12\text{ V}$ supply at nominal gain

low band	$46,5\text{ mA} \pm 10\%$
high band	$63,5\text{ mA} \pm 10\%$

Notes — At 40 dB gain reduction the currents decrease about 5 mA.

- The supply voltage at terminal 4 should be carefully filtered to avoid hum modulation in one of the P-I-N diodes when the attenuator is biased to higher attenuation ratios. Under most unfavourable conditions a ripple voltage of 3 mV (p-p) may produce a disturbance which is just visible.

A.G.C. voltage (Figs 5 and 6)

low band, at nominal gain	$+5 \pm 0,2\text{ V}^*$
at 40 dB gain reduction	$+3,3\text{ V}$ (typical)
high band, at nominal gain	$+5 \pm 0,2\text{ V}^*$
at 40 dB gain reduction	$+3,3\text{ V}$ (typical)

A.G.C. current

at nominal gain	max. 1 mA
with a.g.c.	max. 1 mA

Tuning voltage range (Figs 7 and 8)

Current drawn from 28 V tuning voltage supply	$+0,5$ to $+28\text{ V}$
	max. $0,5\text{ }\mu\text{A}$

Note — The source impedance of the tuning voltage, offered to terminal 6, must be max. $100\text{ k}\Omega$ at tuning voltages below 5 V.

Switching voltage

low band	open circuit
high band	$+12\text{ V} \pm 10\%$

Note — In the low band position the tuner produces a negative voltage (1 to 5 V) at terminal 3; this terminal must not be loaded with an external resistance below $50\text{ M}\Omega$.

* This value may be increased to 5,5 V if a certain deterioration of signal handling is accepted. At voltages above 5,5 V the cross-modulation in band may deteriorate rapidly.

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

ALIGNMENT OF THE I.F. CIRCUIT

For i.f. injection the u.h.f. i.f. input (terminal 1) or the i.f. injection point at the collector of the mixer transistor (at the top of the tuner, Fig. 2) can be used.

The aligning can be done with any channel tuned. A probe as shown in Fig. 9 should be used.

Fig. 9.

The signal attenuation between the i.f. generator and the i.f. output of the tuner is about 4 dB when injection is done via the injection point, and about 8,5 dB in the case of injection via the u.h.f. i.f. input.

The i.f. output circuit is detuned about +300 kHz * or -150 kHz* when injection is done via the injection point or via the u.h.f. i.f. input respectively.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 10.

Fig. 11.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 43,5 MHz. The bandwidth should be approx. 4,5 MHz.

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

U.H.F. TELEVISION TUNER

QUICK REFERENCE DATA

System	C.C.I.R. system M (R.T.M.A.)
Channels	A14 to A78
Intermediate frequencies	
picture	45,75 MHz
sound	41,25 MHz

APPLICATION

This tuner is designed to cover the u.h.f. channels A14 to A78 of C.C.I.R. system M (R.T.M.A.). In combination with a suitable v.h.f. tuner, e.g. ELC3082 it can be used in v.h.f./u.h.f. receivers. Small adaptations in the receiver may be necessary, depending on the receiver type.

DESCRIPTION

The U323 is a u.h.f. tuner with electronic tuning, covering the u.h.f. band from 470 to 860 MHz.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltages, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of an input circuit with a high-pass characteristic, followed by a P-I-N diode attenuator (1 diode BA379) and the input transistor BF480 in grounded-base configuration. This transistor operates at an emitter current of about 8 to 10 mA, featuring good noise figures and good signal handling properties. It also supplies the current drive for the P-I-N diode attenuator, controlled by an a.g.c. voltage fed to the transistor's base. This combination has good signal handling properties throughout the a.g.c. range. The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the mixer diode BA280 (or MBD102). The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator, equipped with a transistor BF480.

The i.f. signal, originated in the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode BA280 (or MBD102) and the i.f. transistor BF324 also features good noise figures and good signal handling properties. Three capacitance diodes BB105B tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the i.f. transistor BF324 has to be provided outside the tuner, preferably by a choke of about $5\ \mu\text{H}$. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the i.f. transistor, connected to terminal 7.

Press-through force: ≥ 10 N

Mass approx. 75 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $5,0 \pm 0,2\text{ V}$.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Miscellaneous

Radio interference

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975).

For the oscillator radiation use is made of the relaxed limit of 3 mV/m (70 dBμV/m).

Microphonics

Therefore will be no microphones, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the i.f. transistor (coupled via a capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 7). The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 6.

Fig. 7.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. $5\ \mu\text{H}$ outside the tuner (Fig. 8). For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 8 should be used.

Fig. 8.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

Fig. 9.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 43,5 MHz; the bandwidth should be approx. 7,5 MHz (Fig. 9). Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 10. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 10.

U.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems I (United Kingdom), G, H and K	
Channels	E21 to E69	
	<u>systems I and K</u>	<u>systems G and H</u>
Intermediate frequencies		
picture	39,5 MHz	38,9 MHz
sound	33,5 MHz	33,4 MHz

APPLICATION

These tuners are for use in u.h.f. single-standard receivers. In combination with v.h.f. tuner V317 or V334 they can also be used in v.h.f./u.h.f. receivers.

The tuners meet the special requirements of the United Kingdom.

The U341 LO is a special version of the U341; an output voltage sample from the local oscillator is available for driving digital tuning systems. Apart from this the tuners are identical.

The tuners are pin-compatible with tuners U321 and U321LO; the a.g.c. circuit is voltage driven, unlike the U321, where the a.g.c. circuit is current driven.

DESCRIPTION

These are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz. The tuner circuit is built on a printed-wiring board and enclosed in a metal housing comprising a rectangular frame and front and rear covers (see Fig. 2). The shielded aerial connection is on one of the frame sides, all other connections (supply voltages, a.g.c., tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Figs 3 and 4.

Tuner U341LO has a coaxial socket on the top of the frame for the oscillator output sample.

Electrically, the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF980. This tetrode operates at a drain current of about 10 mA, and has good noise figures and signal handling properties. It also acts as an a.g.c. device, controlled by an a.g.c. voltage fed to gate 2. This combination has good signal handling properties throughout the a.g.c. range. The drain load of the MOS-FET tetrode is formed by a double tuned circuit which transfers the signal to the mixer diode 1SS99. The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator transistor BF480. At the U341LO the oscillator sample is fed out of the mixer via a small capacitor in series with a resistor.

The i.f. signal, from the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode 1SS99 and the i.f. transistor BF324 ensures good noise figures and signal handling properties. Three capacitance diodes BB405B tune the double tuned circuit and the oscillator.

The i.f. output circuit is single tuned with output coupling from the low impedance side. A d.c. path to earth for the collector current of the i.f. transistor BF324 must be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point is provided at the collector of the i.f. transistor, connected to terminal 7.

- 10 = i.f. output

Note: When the tuner is operated together with a v.h.f. tuner, only the supply voltage at terminal 6 should be switched off during v.h.f. operation.

Fig. 2b I.F. output coil.
Torque for alignment: 2 to 15 mNm
Press-through force: ≥ 10 N

Mass approx. 75 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board with connections as shown by the piercing diagram in Fig. 3. (The tuner may also be mounted in a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in a cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

A coaxial plug has to be used for connection to the socket on the top of tuner U341LO; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

The aerial cable should be connected as follows:

- strip the cable according to Fig. 4B;
- fix the cable as indicated in Fig. 4C and solder the inner conductor on the aerial tag;
- insert lugs on immunity shield under the tabs on tuner body, push the shield into position so that the locating tags snap into place in the tuner body.

Fig. 4 Fixing of the aerial cable. Inner conductor soldered on aerial tag

Recommended cable: DAVU wire CX4004 (outer sheath diameter 5,32 mm).

ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner when used with a v.h.f. tuner V317 or V334. Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Miscellaneous

Radio interference

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975), and BS905*.

Immunity from radiated interference

Aerial terminal meets requirements of BS 905, provided the tuner is installed in a professional manner.

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* For U341LO: when the oscillator sample socket is either open or terminated with a coaxial plug (75 Ω impedance, e.g. type 3/2-50, Daut und Rietz).

ADDITIONAL INFORMATION

I.F. injection

The tuner has an i.f. injection point at the collector of the i.f. transistor (coupled via a small capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 8).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 7.

Fig. 8.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. $5\ \mu\text{H}$ outside the tuner (Fig. 9). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can inhibit the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the receiver i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 9 should be used.

Fig. 9.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 7.

Fig. 10.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,5 MHz; the bandwidth should be approx. 5 MHz (Fig. 10). Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 11. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 11.

U.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems G, H, I and K	
Channels	E21 to E69	
Intermediate frequencies	systems G and H	systems I and K
	38,9 MHz	39,5 MHz
	33,4 MHz	33,5 MHz

APPLICATION

These tuners are designed to cover the u.h.f. channels E21 to E69 of C.C.I.R. systems G, H, I and K. In combination with a suitable v.h.f. tuner, e.g. V317 or V334, they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel.

The U342LO is a special version of the U342; an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz.

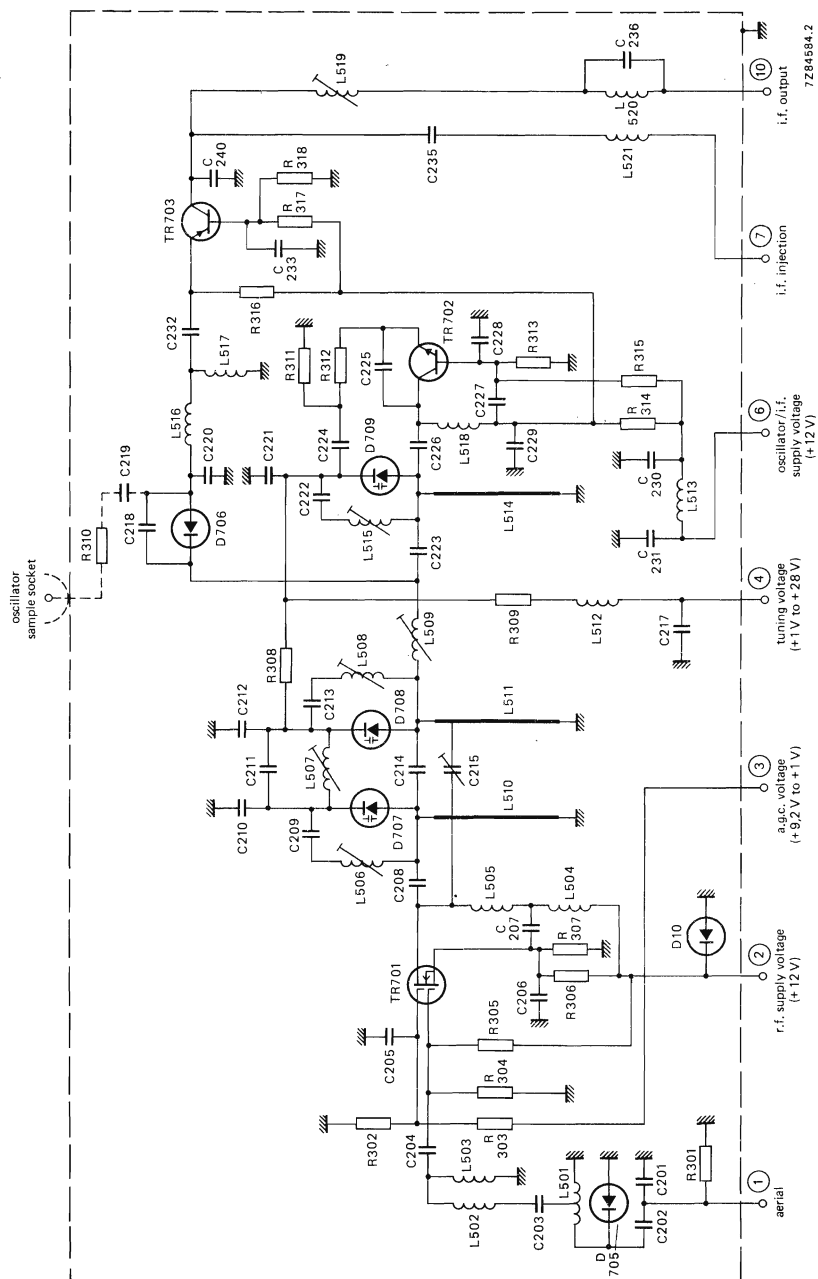

Mechanically, the tuners are built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame, and front and rear covers (see Fig. 2a). All connections (aerial, supply voltages, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3. Tuner U342LO has a coaxial socket on the top of the frame for coupling out the oscillator sample.

Electrically, the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF980. This tetrode operates at a drain current of about 10 mA, featuring good noise figures and good signal handling properties. It also acts as an a.g.c. device, controlled by an a.g.c. voltage fed to gate 2. This combination has good signal handling properties throughout the a.g.c. range. The drain load of the MOS-FET tetrode is formed by a double tuned circuit, transferring the signal to the mixer diode 1SS99. The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator, equipped with a transistor BF480. At the U342LO the oscillator sample is coupled out of the mixer via a small capacitor in series with a resistor.

The i.f. signal, originated in the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode 1SS99 and the i.f. transistor BF324 also features good noise figures and good signal handling properties. Three capacitance diodes BB405B tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the i.f. transistor BF324 has to be provided outside the tuner, preferably by a choke of about $5\ \mu\text{H}$. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the i.f. transistor, connected to terminal 7.

MECHANICAL DATA

Dimensions in mm

Fig. 2a The oscillator sample socket, drawn with dotted lines, applies only to tuner U342LO.

Terminal 1 = aerial

2 = r.f. supply voltage, + 12 V

3 = a.g.c. voltage, + 9,2 to + 1 V

4 = tuning voltage, + 1 to + 28 V

6 = oscillator/i.f. supply voltage, + 12 V

7 = i.f. injection point

10 = i.f. output

Note: When the tuner is operated together with a v.h.f. tuner, only the supply voltage at terminal 6 should be switched off during v.h.f. operation.

Fig. 2b I.F. output coil.

Torque for alignment: 2 to 15 mNm

Press-through force: ≥ 10 N

Mass approx. 75 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted into a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

For connection to the socket on the top of tuner U342LO a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner in combination with a v.h.f. tuner V317 or V334. Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 6, i.e. a 100 pF capacitor is connected in parallel with C1; tuning voltage 15 V.

Detuning of the i.f. output circuit as a result of r.f. tuning

max. 500 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 6, i.e. a 100 pF capacitor is connected in parallel with C1; tuning voltage 15 V.

Minimum tuning range of i.f. output coil

33 to 40 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 6; tuning voltage 15 V.

Attenuation between i.f. injection point and i.f. output of the tuner

typ. 23 ± 3 dB

Miscellaneous

Radio interference

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72*

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* For U342LO: when the oscillator sample socket is either open or terminated with a coaxial plug (75 Ω impedance, e.g. type 3/2-50, Daut und Rietz).

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the i.f. transistor (coupled via a small capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 7). The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 6.

Fig. 7.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. $5\mu\text{H}$ outside the tuner (Fig. 8). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 8 should be used.

Fig. 8.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

Fig. 9.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 5 MHz (Fig. 9).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 10. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 10.

QUICK REFERENCE DATA

Systems	C.C.I.R. systems I (United Kingdom), G, H and K	
Channels	E21 to E69	
Intermediate frequencies	systems G and H	systems I and K
picture	38,9 MHz	39,5 MHz
sound	33,4 MHz	33,5 MHz

APPLICATION

Designed to cover the u.h.f. channels of C.C.I.R. systems I, G, H and K in u.h.f. single standard receivers. They meet the special requirements of the United Kingdom. Tuner U412 is equipped with a frequency divider, which makes this type suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type U411.

DESCRIPTION

The U411 and U412 are u.h.f. tuners with electronic tuning. They meet the special requirements of the United Kingdom and are pin-compatible with the UV411, UV413, UV415, and the UV412, UV414, UV416 respectively. Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2a). The coaxial aerial connection of $75\ \Omega$ is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning voltage, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically (see Fig. 1), the tuners consist of a bandpass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The selectivity of this circuit at the image frequency is such that it meets the stringent requirements of the U.K.

The i.f. signal from the mixer is amplified by an i.f. transistor connected in grounded-base configuration. The combination of Schottky barrier diode and i.f. transistor ensures good noise figures and good signal handling properties.

The double tuned circuit and the oscillator circuit are tuned by 3 BB405B capacitance diodes. The i.f. output circuit of the tuner is a single tuned circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the i.f. amplifier transistor. The tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the U412 is extended with a frequency divider (division ratio of 256) the inputs of which are connected to the oscillator. The outputs are balanced; they are connected to terminals 12 and 13. The output voltage is determined by the external load and the supply voltage, which is connected to this load. They should be chosen such that:

- The output voltage rating of 10 V is not exceeded;
- The output voltage does not drop more than 1,6 V below 5 V supply voltage of frequency divider);
- The output voltage swing does not exceed 1 V.

Radiation by the output signal may be reduced by transporting the two complementary signals via twisted wires or a flat cable, even if only one signal is to be used to drive the subsequent circuit.

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation. However it is recommended that it is placed in the cool part of the cabinet and away from loudspeaker vibrations.

The solderability of the terminals and mounting tabs (except cut edges) is according to IEC 68-2, test Ta (230 ± 10 °C, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage) can be used as i.f. injection point, provided the supply voltage is applied to terminal 4 via a resistor of 10 Ω (see Fig. 7). The tuning voltage should be 15 V.

Fig. 7.

Connection of the i.f. amplifier

Connection to the i.f. amplifier should be either by a printed connection of minimum length or by a shielded connection such as a coaxial cable.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

Fig. 8.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 36,5 MHz; the bandwidth is approx. 5 MHz (Fig. 8). Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 9. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 9.

U.H.F. TELEVISION TUNER

with diode tuning

QUICK REFERENCE DATA

Systems	L (standard)
Channels	E21 to E69
Intermediate frequencies	
picture	32.7 MHz
sound	39.2 MHz

APPLICATION

This tuner covers u.h.f. channels E21 to E69 to meet the special requirements of television sets in France.

DESCRIPTION

The UF5 is a u.h.f. tuner with electronic tuning, covering the u.h.f. band from 470 to 860 MHz (channels E21 to E69).

The tuner circuit is built on a printed wiring board, and enclosed in a metal housing comprising a rectangular frame with front and rear covers. (See Fig. 2).

A shielded aerial lead is fitted to one of the shorter sides of the frame, all the other terminals (supply-input stage, a.g.c., tuning voltage, supply for oscillator and i.f. stage, i.f. injection and i.f. output) are made via connecting pins in the underside. Mounting is as shown in Figs 2 and 3.

Electrically, the tuner consists of an input circuit with high pass characteristic, followed by a transistor in grounded base configuration (see Fig. 1). The collector load of the input transistor is formed by a double tuned circuit with inductive bottom end coupling to the mixer stage. The i.f. signal, originated in the mixer stage, is amplified by a second transistor in grounded base configuration.

3-variable capacitance diodes tune the double tuned circuit and the oscillator.

The i.f. output signal is extracted from the low end of the double-tuned output circuit.

A d.c. path to ground for the collector current of the i.f. transistor is provided inside the tuner.

The sound i.f. frequency is 39,2 MHz and the vision i.f. frequency is 32,7 MHz.

Mass

approx. 75 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, with connections as shown by the piercing diagram in Fig. 3. (The tuner may also be mounted in a socket. Information will be supplied upon request).

It is recommended that the tuner be installed in a cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3.

ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone. Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0.3\text{ V}$ and an a.g.c. current of $-9\text{ mA} \pm 0.2\text{ mA}$.

Within the given tolerance range of supply voltage and a.g.c. current, only insignificant deviations from the specified values can be expected.

Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G
Channels	
v.h.f. I	NZ1 to C
v.h.f. III	M4 to E12
u.h.f.	E21 to E69
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, with extended v.h.f. frequency ranges.

Tuner UV412 is equipped with a frequency divider, which makes this type suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type UV411.

DESCRIPTION

The UV411 and UV412 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the v.h.f. band I including the New Zealand channel 1, and the Italian channel C (frequency range 44 to 92 MHz), the v.h.f. band III including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common aerial connection (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band I/III wide band input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. and f.m. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the UV412 is extended with a frequency divider SAB1077 (division ratio of 256), which inputs are connected to the v.h.f. and u.h.f. oscillator. The outputs are complementary open-collector current sources; they are connected to terminals 12 and 13. The output voltage is determined by the external load and the supply voltage, which is connected to this load. They should be chosen such that:

- the output-voltage rating of 10 V is not exceeded;
- the output voltage does not drop more than 1,6 V below 5 V (supply voltage of frequency divider);
- the output-voltage swing does not exceed 1 V.

Radiation by the output signal may be reduced by transporting the two complementary signals via twisted wires or a flat cable, even if only one signal is to be used to drive the subsequent circuit.

Miscellaneous

Radio interference

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975) and VDE0872/7.72.

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of $10\ \Omega$ (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 2 V.

Fig. 11.

Connection of the i.f. amplifier

No special precautions are required to load and to match the i.f. output of the tuner.

Connection of supply voltages

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth is approx. 5 MHz (Fig. 13).

Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

v.h.f. III	E5 to E12
u.h.f.	E21 to E60
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, with extended v.h.f. frequency ranges.

The tuners comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of Amtsblatt DBP69/1981.

Tuner UV414 is equipped with a frequency divider, which makes this type suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type UV413.

DESCRIPTION

The UV413 and UV414 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the v.h.f. band I (frequency range 47 to 68 MHz), the v.h.f. band III including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 790 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common aerial connection (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via feed-through capacitors in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band I/III wide band input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. and f.m. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode.

The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The input, r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the UV414 is extended with a frequency divider SAB1077 (division ratio of 256), which inputs are connected to the v.h.f. and u.h.f. oscillator. The outputs are complementary open-collector current sources; they are connected to terminals 12 and 13. The output voltage is determined by the external load and the supply voltage, which is connected to this load. They should be chosen such that:

- the output-voltage rating of 10 V is not exceeded;
- the output voltage does not drop more than 1,6 V below 5 V (supply voltage of frequency divider);
- the output-voltage swing does not exceed 1 V.

Radiation by the output signal may be reduced by transporting the two complementary signals via twisted wires or a flat cable, even if only one signal is to be used to drive the subsequent circuit.

only for UV414

Mass approx. 127 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

(1) Only for UV414.

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is $\pm 0,05$ mm.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

voltage at the aerial terminal

within the limits of C.I.S.P.R. 13
(1975), VDE 0872/7.72 and
Amtsblatt DBP69/1981.

Immunity from radiated interference

aerial input terminal meets the
requirements of Amtsblatt
DBP69/1981, item 5.3.2.

Microphonics

there will be no microphonics,
provided the tuner is installed
in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the
aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of $10\ \Omega$ (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 2 V.

Fig. 11.

Connection of the i.f. amplifier

No special precautions are required to load and to match the i.f. output of the tuner.

Connection of supply voltages

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth is approx. 5 MHz (Fig. 13).

Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

high v.h.f.	S2 to S19
u.h.f.	E21 to E69
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

To cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, including the S channels for cable television.

Tuner UV416 has a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; it is otherwise the same as type UV415.

Tuners UV415 and UV416 are pin-compatible with UV411 and UV412 respectively.

DESCRIPTION

The UV415 and UV416 are combined v.h.f./u.h.f. tuners with electronic tuning and bandswitching, covering the low v.h.f. band (frequency range 47 to 111 MHz), high v.h.f. band (frequency range 111 to 293 MHz) and u.h.f. band (frequency range 470 to 861 MHz).

The tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common aerial connection (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

The tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via a tuned input circuit, switchable between the low and high v.h.f. bands, to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). Additional i.f. and i.f. rejection is incorporated in the input circuit. The drain load of the MOSFET tetrode is a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) allows i.f. injection to align the i.f. output circuit of the tuner with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 6 tuning diodes; band switching is achieved by 6 switching diodes.

The u.h.f. part of the tuner has a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, which operates as an i.f. amplifier.

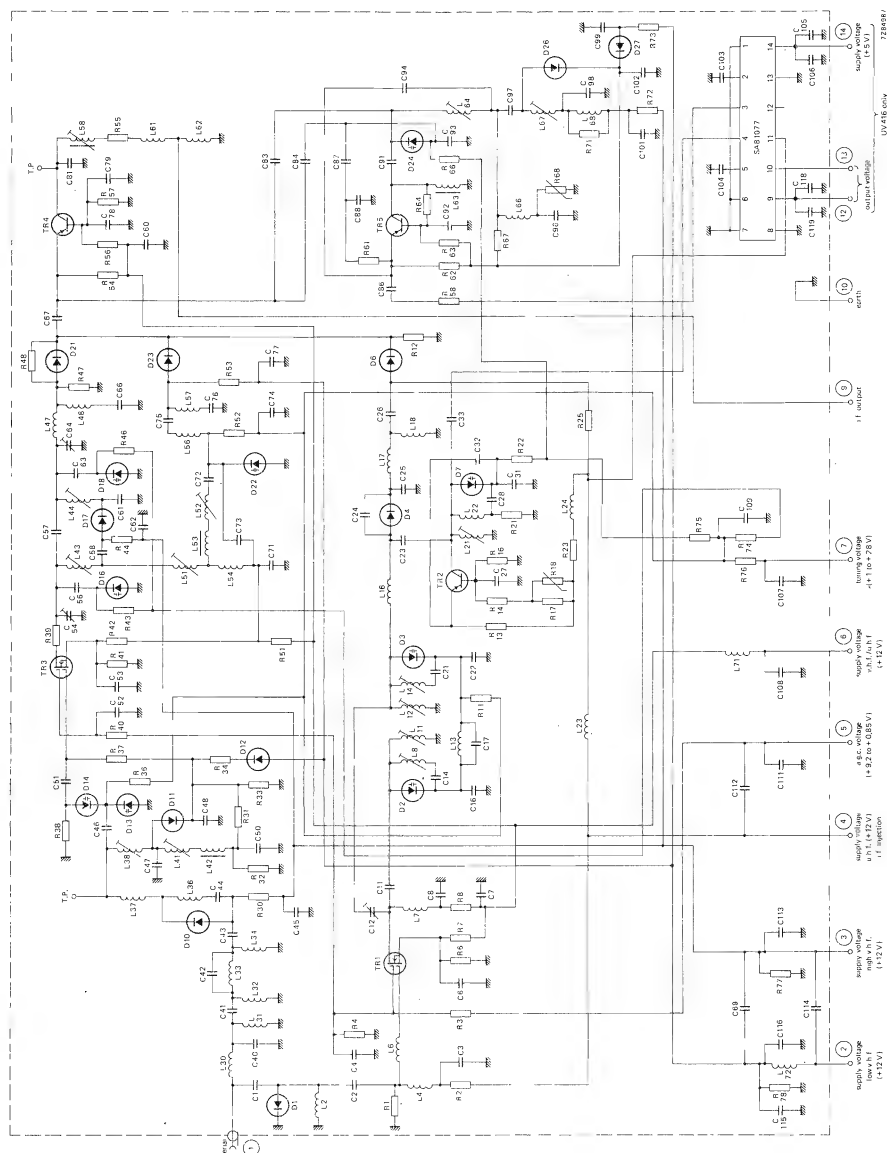

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The circuit of the UV416 is extended with a frequency divider SAB1077 (division ratio of 256), with inputs connected to the v.h.f. and u.h.f. oscillator. The outputs are complementary open-collector current sources connected to terminals 12 and 13. The output voltage is determined by the external load and the supply voltage, which is connected to this load. They should be such that:

- the output-voltage rating of 10 V is not exceeded;
- the output voltage does not drop more than 1,6 V below 5 V (supply voltage of frequency divider);
- the output-voltage swing does not exceed 1 V.

Radiation of the output signal may be reduced by feeding the two complementary signals via twisted wires or a flat cable, even if only one signal is to be used to drive the subsequent circuit.

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

(1) Only for UV416.

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is $\pm 0,05$ mm.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

Connection of supply voltages

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth is approx. 5 MHz (Fig. 13).

Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

DEVELOPMENT SAMPLE DATA

This information is derived from development samples made available for evaluation. It does not necessarily imply that the device will go into regular production.

UVF10

V.H.F./U.H.F. TELEVISION TUNER

QUICK REFERENCE DATA

Systems	C.C.I.R. systems L and L'
Channels	
v.h.f. I	A to E4, including A to C
v.h.f. III	M4 to E12, including 1 to 6
u.h.f.	E21 to E69
Intermediate frequencies	
picture	32,7 MHz
sound	39,2 MHz

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems L and L'.

DESCRIPTION

The UVF10 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching covering the v.h.f. band I including the European channel E4 (frequency range 41 to 68 MHz), the v.h.f. band III including the Moroccan channel M4 and the European channel E12 (frequency range 162 to 230 MHz) and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common aerial connection (v.h.f. and u.h.f.) with standard coaxial termination is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band I/III wideband input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the output circuit of the tuner together with the i.f. amplifier of the television receiver.

The input tuned circuit, the r.f. bandpass filter and oscillator circuit are tuned by 4 tuning diodes, band switching is achieved by 8 switching diodes.

The u.h.f. part of the tuner consists of a tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The input tuned circuit, the r.f. bandpass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

Mounting

The tuner may be mounted by soldering it onto a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

DEVELOPMENT SAMPLE DATA

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $8,25 \pm 0,2\text{ V}$.

Voltages and currents

Supply voltage	$+12\text{ V} \pm 1\text{ V}$
Current drawn from $+12\text{ V}$ supply	
band I	max. 45 mA; typ. 40 mA
band III	max. 60 mA; typ. 55 mA
bands IV and V	max. 50 mA; typ. 45 mA

Bandswitching

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:

- terminal 2 and -12 V to terminal 3 for operation in band I
- terminal 3 and -12 V to terminal 2 for operation in band II
- terminal 4 and -12 V to terminals 2 and 3 for operation in bands IV and V.

A.G.C. voltage (Figs 4, 5 and 6)	
voltage range	$+8,25\text{ to }+0,85\text{ V}$
voltage at nominal gain	$+8,25 \pm 0,5\text{ V}$
voltage at 40 dB gain reduction

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of $56\ \Omega$ (see Fig. 10). The u.h.f. band should be switched on; a tuning voltage of -12 V is applied to terminal 7.

Fig. 10.

Connection of the i.f. amplifier

No special precautions are required to load and to match the i.f. output of the tuner.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the circuit given in Fig. 11.

Fig. 11.

This circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit (Fig. 12).

Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and the circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Fig. 12.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 13. A suitable tool is available under catalogue number 7122 005 47680.

DEVELOPMENT SAMPLE DATA

V.H.F. TELEVISION TUNER

- with diode tuning

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and I	
Channels	system B	system I
v.h.f. I	NZ1 to E4	IA to IC
v.h.f. III	E5 to E12	ID to IJ
Intermediate frequencies		
picture	38,9 MHz	39,5 MHz
sound	33,4 MHz	33,5 MHz

APPLICATION

This tuner is designed to cover the v.h.f. channels of C.C.I.R. systems B and I. In combination with the u.h.f. tuner U322 it can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

DESCRIPTION

The V311 is a v.h.f. tuner with electronic tuning, covering the v.h.f. band I (44 to 68 MHz) and the v.h.f. band III (174 to 230 MHz). Switching between the bands is done automatically by a built-in comparator circuit.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the under side. The mounting method is shown in Fig. 3.

Electrically the tuner consists of two input circuits in parallel (bands I and III) with band-pass characteristics, followed by a p-i-n diode attenuator (2 diodes BA379) and the input transistor AF379 in grounded-base configuration. This transistor operates at an emitter current of about 4 to 12 mA, featuring good noise figures and good signal handling properties. It also supplies the current drive for the p-i-n diode attenuator, controlled by an a.g.c. voltage fed to the transistor's base. This combination has good signal handling properties throughout the a.g.c. range.

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the self-oscillating mixer AF367. The selectivity of this circuit at the intermediate frequency has been improved.

Four capacitance diodes BB106 tune the double-tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

A comparator circuit supplying the automatic switching-over between bands I and III consists of two p-n-p transistors, the emitters of which have the same stabilized 5.6 V reference voltage, thereby supplying a very good temperature and supply voltage dependence. The voltage divider at the input of the circuit consists of two high-ohmic resistors to prevent unacceptable loading of the tuning voltage.

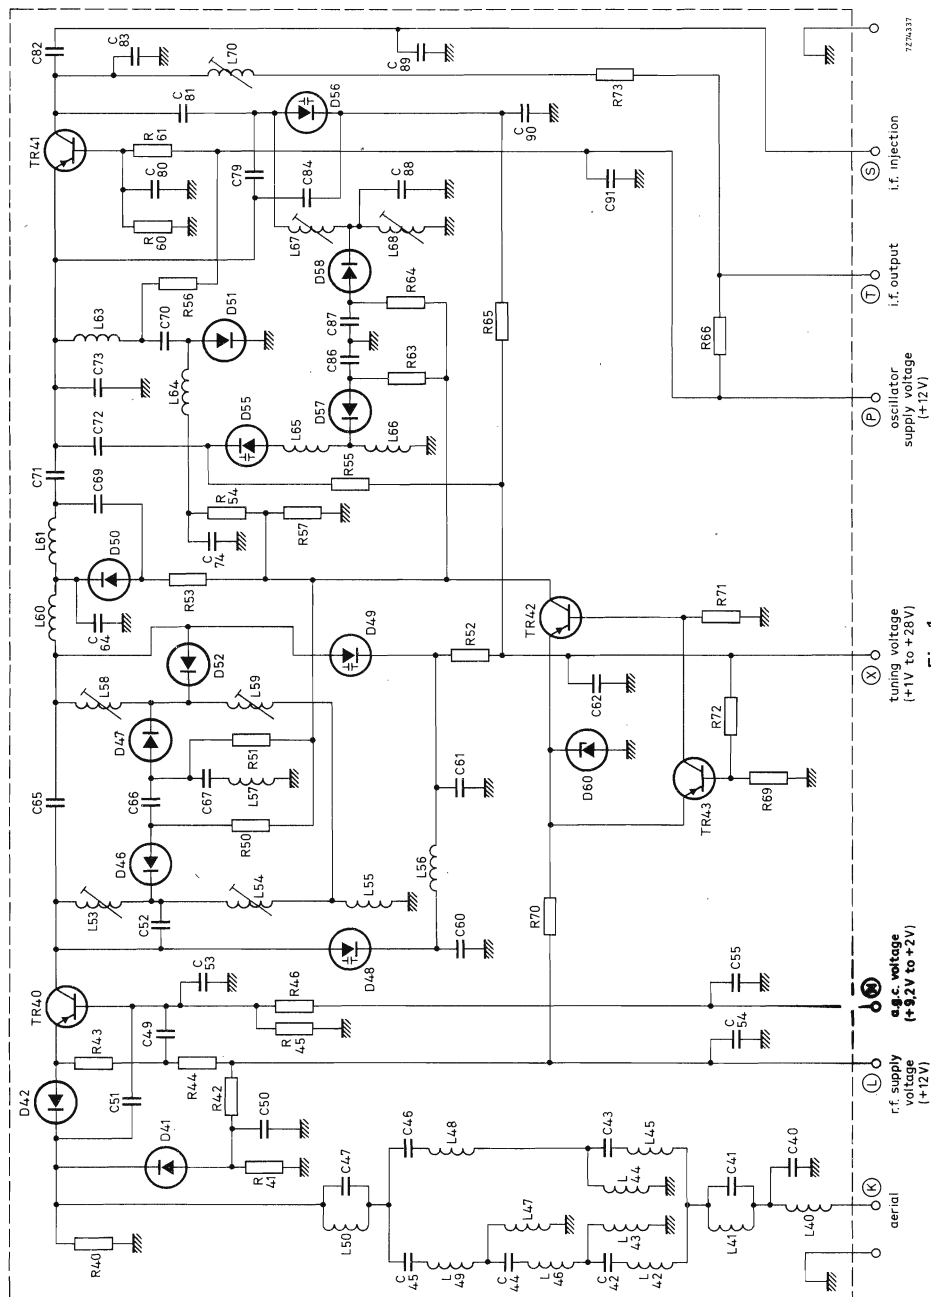

Fig. 1.

MECHANICAL DATA

Note

When the tuner is operated together with a u.h.f. tuner, only the supply voltage at terminal P should be switched off during u.h.f. operation.

Fig. 2b I.F. output coil.

Torque for alignment: 2 to 15 mNm

Press-through force: ≥ 10 N

Mass

approx. 80 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request).

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner in combination with a u.h.f. tuner U322.

Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected.

Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

General

Protection against flashes

max. 30 kV, 400 mWs

Note

A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* I.F. output of the tuner terminated with the circuit shown in Fig. 10; tuning voltage is 15 V.

ADDITIONAL INFORMATION

If the tuner is used in receivers designed for v.h.f. only, a capacitor of 5,6 pF should be applied between the aerial input and earth.

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor to terminal S). The i.f. generator can be connected directly to this point (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. 5 μ H outside the tuner (Fig. 12).

In the case where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used.

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 5 MHz (Fig. 13).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 009 47680.

Fig. 14.

V.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G
Channels	
v.h.f. I	E2 to R5
v.h.f. III	S2 to S19
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

These tuners are designed to cover the v.h.f. channels of C.C.I.R. systems B and G, including the S channels for cable television.

In combination with the u.h.f. tuner U322, U324, U342 or U342LO respectively, they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

The tuners are pin-compatible with tuners V314, V315 and V334.

The V317LO is a special version of the V317: an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are v.h.f. tuners with electronic tuning, covering the v.h.f. band I (47 to 101 MHz) and the v.h.f. band III (111 to 293 MHz). Switching between the bands is done by external band switching.

Mechanically, the tuners are built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Figs 3. Tuner V317LO has a coaxial socket on the top of the frame, for coupling out the oscillator sample.

Electrically the tuner consists of two tunable input circuits in parallel (bands I and III), each followed by an r.f. transistor in grounded-base configuration (BF939 for band I, BF967 for band III). The collector load of each input transistor is formed by a double tuned circuit, transferring the signal to the mixer BF324 fed by the oscillator BF606A. Seven capacitance diodes BB909A tune the double-tuned circuits and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about $5\ \mu\text{H}$. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

MECHANICAL DATA

Dimensions in mm

Fig. 2a The oscillator sampling socket, drawn with dotted lines, applies only to tuner V317LO.

- Terminal T = i.f. output
 X = tuning voltage, +1 to +28 V
 P = supply voltage, band III, +12 V
 S = i.f. injection point

Mass

approx. 80 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

For connection to the socket on the top of tuner V317LO a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner in combination with a u.h.f. tuner U322, U324, U342 or UL342LO respectively. Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3\text{ V}$ and an a.g.c. voltage of $9,2 \pm 0,2\text{ V}$.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

(1975) and VDE0872/7.72*.

* For V317LO: when the oscillator sample socket is either open or terminated with a coaxial plug (75 Ω impedance, e.g. type 3/2-50, Daut und Rietz).

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor and a resistor to terminal S). The i.f. generator can be connected directly to this point (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. 5 μ H outside the tuner (Fig. 12). Where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used (During v.h.f. operation the voltage across the 470 Ω resistor is 1 to 1,2 V).

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 6 MHz (Fig. 13).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

V.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G
Channels	
v.h.f. I	NZ1 to C
v.h.f. III	M4 to E12
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

These tuners are designed to cover the v.h.f. channels of C.C.I.R. systems B and G, including the Italian and Moroccan channels.

In combination with the u.h.f. tuner U322, U324, U342 or U342LO respectively, they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

The tuners are pin-compatible with tuners V314, V315 and V317.

The V334LO is a special version of the V334; an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are v.h.f. tuners with electronic tuning, covering the v.h.f. band I (44 to 88 MHz) and the v.h.f. band III (162 to 230 MHz). Switching between the bands is done by connecting the supply voltage to terminal V for band I and to terminal P for band III.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3. Tuner V334LO has a coaxial socket on the top of the frame for coupling out the oscillator sample.

Electrically the tuner consists of two input circuits in parallel (bands I and III) with band-pass characteristics, switchable for band I and band III, followed by a MOS-FET amplifier stage. The drain load of the MOS-FET is formed by a double tuned circuit, transferring the signal to the self-oscillating mixer BF967. The selectivity of this circuit at the intermediate frequency has been improved. Three capacitance diodes BB109G (or BB809) tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

Miscellaneous**Radio interference**

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72*.

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

If the tuner is used in receivers designed for v.h.f. only, a capacitor of 6,8 pF should be applied between the aerial input and earth.

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor and a resistor to terminal S). The i.f. generator can be connected directly to this point. (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

* For V334LO: when the oscillator sample socket is either open or terminated with a coaxial plug (75 Ω impedance, e.g. type 3/2-50, Daut und Rietz).

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. $5\ \mu\text{H}$ outside the tuner (Fig. 12). Where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used. (During v.h.f. operation the voltage across the $470\ \Omega$ resistor is 1 to 1,2 V).

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to $75\ \Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to $36,15\ \text{MHz}$; the bandwidth should be approx. $6\ \text{MHz}$ (Fig. 13). Because the input and output impedances of the tuner are now $75\ \Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a $75\ \Omega$ source and a $75\ \Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

APPLICATION

This tuner covers the v.h.f. channels of systems E, L and L'. In combination with the u.h.f. tuner UF5, it can be used in v.h.f./u.h.f. television receivers. The aerial inputs and i.f. outputs of both tuners can be connected in parallel without additional circuitry.

DESCRIPTION

The VF5 is a v.h.f. television tuner with electronic tuning, covering the v.h.f. band I and the v.h.f. band III. Switching between the bands is done by external switching.

The tuner circuit is built on a printed wiring board, and enclosed in a metal housing, comprising a rectangular frame with front and rear covers (see Fig. 2).

A shielded aerial lead is fitted to one of the shorter sides of the frame, all other connections (supply-input stage, a.g.c., tuning voltage, switching voltages, i.f. input from u.h.f. tuner, supply for oscillator and i.f. stage, and i.f. output) are made via terminals in the underside. Mounting as in Fig. 3.

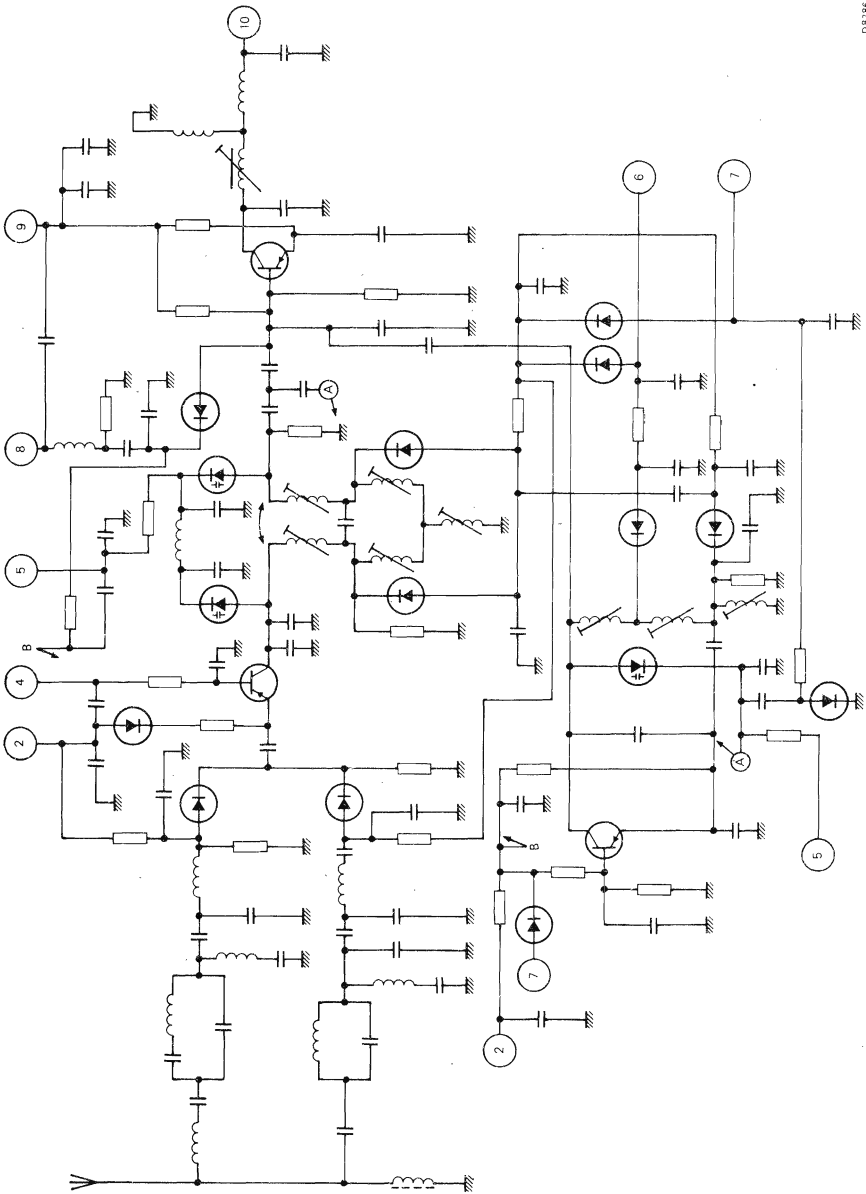

Electrically the tuner consists of two input circuits in parallel (band I and band III) with band-pass characteristics and has the input transistor connected in grounded-base configuration. This transmitter operates at an emitter current of about 4 to 12 mA, featuring good noise figures and good signal handling properties. This combination has good handling properties throughout the a.g.c. range. The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the self-oscillating mixer. 3-variable capacitance diodes tune the double tuned circuits and the oscillator. The i.f. output signal is extracted from the low end of the single-tuned output circuit.

A d.c. path to earth for the collector current of the mixer is provided inside the tuner.

An i.f. injection point is provided. Access is through a hole in the cover.

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, with connections as shown by the piercing diagram in Fig. 3. (The tuner may also be mounted in a socket. Information will be supplied upon request).

It is recommended that the tuner be installed in a cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner when used with the u.h.f. tuner UF5. Unless otherwise specified all electrical values apply at an ambient temperature of $25 \pm 5^\circ\text{C}$, a relative humidity of $60 \pm 15\%$ and a supply voltage of $12 \pm 0.1\text{ V}$. Under the extreme conditions of temperature and humidity given below, the tuner will function normally, but some specified limits may be exceeded.

COAXIAL AERIAL INPUT ASSEMBLIES

APPLICATION

These coaxial aerial input assemblies have been developed for application in television sets with 75 ohm input impedance, for use in v.h.f. as well as in u.h.f. (40-890 MHz). The connectors meet the demands of both the IEC standards (diameter 9,5 mm) and the French standards (diameter 9,0 mm). They have to be used with plugs complying with the properties mentioned in DIN 45325, IEC 169-2 (diameter 9,5 mm) and SNIR (diameter 9,0 mm). The units meet the safety requirements of IEC 65.

COAXIAL AERIAL INPUT ASSEMBLY

APPLICATION

This coaxial aerial input assembly has been developed for application in TV sets with $75\ \Omega$ input impedance, for use in v.h.f. as well as in u.h.f. bands. Thanks to the use of safety capacitors in the assembly, the chassis of the TV set is separated from the aerial input. The connector for the aerial input meets the demands of the IEC standards (diameter 9,5 mm) and the French standards (diameter 9,0 mm).

The coaxial aerial input assembly complies with the requirements of immunity from radiated interference of BS 905. It meets the safety requirements of IEC 65; approbation approvals have been sought from KEMA, VDE, SEV, BSI, DEMKO, NEMKO, SEMKO, EI and LCEE.

DESCRIPTION

The assembly is provided with safety capacitors, which are moulded in thermo-setting insulation material, thus forming a capacitor block. This capacitor block is built in a metal housing, with lid, which is carried by a plastic fixing plate. All points to the safety capacitors are press contacts, achieved by the metal housing. The housing has an outlet for the coaxial cable to the television tuner.

ELECTRICAL DATA

The electrical values are measured at an ambient temperature of 25 ± 5 °C and a relative humidity of $60 \pm 15\%$.

MECHANICAL DATA

Dimensions in mm

Fig. 2.

MOUNTING

The assembly can be mounted to the chassis of the TV set with two self-tapping screws, 4N x 9,5.

It must be connected to the tuner via a coaxial cable with a diameter of 3 mm. The inner cable conductor should be soldered to the metal plating of the capacitor block, and the cable earth sheath to the metal housing, see Fig. 3.

The soldering conditions are: 340 °C, 2 s.

Plugs to be used with the assembly have to comply with the properties mentioned in DIN 45325, IEC 69-2 (9,5 mm diameter) and SNIR (9 mm diameter).

It is advised not to use aluminium plugs.

VIDEO MODULATORS

VIDEO MODULATORS

QUICK REFERENCE DATA

	REMO 101	REMO 201
C.C.I.R. system	G	I
Channels	E30 to E40	E30 to E40
Inter-carrier sound frequency	5,5 MHz	6 MHz

APPLICATION

These video modulators are for use in:

- video tape recorders (VCR);
- TV cameras;
- video games;
- video information systems;
- closed circuit TV video systems.

DESCRIPTION

In the video modulator, video and sound signals are modulated onto a u.h.f. carrier. The modulated carrier at the output is suited for connection to the antenna socket of normal television receivers. The carrier frequency can be adjusted from 540 to 624 MHz (channel E30 to channel E40) so 10 different channels can be linked via a single coaxial cable.

The modulators meet the radiation requirements of C.I.S.P.R. Recommendation No. 13.

Mechanically, the modulators are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 1). The u.h.f. output connection is on the top of the housing, all other connections are made via feed-through capacitors on the underside. The mounting method is shown in Fig. 2.

VIDEO MODULATOR

QUICK REFERENCE DATA

C.C.I.R. system	L
Channels	E30 to E40
Sound frequency	6,5 MHz

APPLICATION

These video modulators are for use in:

- video tape recorders (VCR);
- TV cameras;
- video games;
- video information systems;
- closed circuit TV video systems.

DESCRIPTION

In the video modulator, video and sound signals are modulated onto a u.h.f. carrier. The modulated carrier at the output is suited for connection to the aerial socket of normal television receivers. The carrier frequency can be adjusted from 540 to 624 MHz (channel E30 to channel E40) so 10 different channels can be linked via a single coaxial cable.

The modulator meets the radiation requirements of C.I.S.P.R. Recommendation No 13.

Mechanically, the modulators are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 1). The u.h.f. output connection is on the top of the housing, all other connections are made via feed-through capacitors in the underside. The mounting method is shown in Fig. 2.

MECHANICAL DATA

Dimensions in mm

Fig. 1.

- Terminal 1 = sound input
 2 = supply voltage, + 12 V
 3 = video input
 E = earth

Mounting

The modulator may be mounted by soldering on to a printed-wiring board, with connections shown by the piercing diagram in Fig. 2.

The solderability of the terminals and mounting tabs is in accordance with IEC68-2, test Ta ($230 \pm 10^\circ\text{C}$; $2 \pm 0,5$ s). The resistance to soldering heat is in accordance with IEC68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 2 Piercing diagram viewed from solder side of board; $e = 2,54$ mm ($0,1$ in).

SURFACE ACOUSTIC WAVE FILTERS

SURFACE ACOUSTIC WAVE FILTER

The RW153A is a lithium niobate surface wave device for use as an i.f. bandpass filter in colour and monochrome TV receivers. Its low input capacitance improves the signal handling capabilities of the driving pre-amplifier. It is specifically designed for CCIR system I as used in the United Kingdom. Its use in place of conventional LC circuitry improves the amplitude and group delay characteristics, as well as avoiding the necessity for critical adjustments during receiver production. The response characteristics are stable with life.
